MAGNETORHEOLOGICALLY CONTROLLED SUSPENSION

Ferrari
California **T**

Ferrari Genuine allows owners to install this semi-active suspension control system even in vehicles not originally equipped with the technology. The system exploits the capability of magnetorheological fluids, which contain ferromagnetic particles in suspension, to react to the magnetic field and offer variable damping action.

This phenomenon allows the SCM system to adjust damping action rapidly in response to the effective shock and vibration transmitted to the vehicle from the road, significantly reducing roll and ensuring more effective vehicle response to driver control input, to offer a distinctly sporty driving experience.
